Office of Planetary Observations

At Office of Planetary Observations, we draw on 'Big Data' to frequently map environmental variables using state-of-the-science satellite observations. This means creating time series analysis for the purposes of living WITHIN nature and for the benefit of Earth.

We supply satellite time series analysis products of environmental variables to your determined boundary and time period. That is every five days at 10m resolution, providing quantitative data sets. Enquire about our services in creating benchmark data sets and time series analysis of environmental indices. We supply low cost, easy to access analysis packs for government policy, city planning, urban development and agricultural purposes allowing for evidence-based decision making. We tailor to watersheds, municipality boundaries, mesh blocks, forest outlines or otherwise specific to your needs.
