Future Grid

Future Grid has invented breakthrough technology called Data Engineering that makes previously impossible analytics, possible. Did you know analytics teams spend over 80% of their time preparing data in readiness for analytics?

Data Engineering eliminates this unproductive effort using patented technology and processes that turns data into operationally ready information. Built for Industry 4.0, Data Engineering is currently in production with some of the world's largest Utilities who turn data from millions of IoT sensors into automated operational outcomes that increase reliability, increase safety and reduce operating cost.

Future Grid is based in Australia with offices in New Zealand, Thailand, and the United States.
