## ROK Technology Pty Ltd

### Storage Cluster in a Box

Our Ceph based storage appliances are a turn-key software-defined storage cluster that use multiple, integrated RISC based Micro Servers in a single RU server. Our storage appliances are an affordable, scalable storage solution for mid and large-scale enterprises and data centres. A web-based "Management User Interface" is available for ease of management and due to its clustered design, there is no single point of failure with the ability to "self-heal" without data loss and no impact on availability.

Our storage appliances are suited to a variety of application stores including object storage, block storage and file systems. Due to the use of low power RISC based Micro Servers, our storage appliances have a low power consumption of around 100~105-Watts, not much more than a desktop PC. We offer extensive supporting services to ensure a successful implementation and a low total cost of ownership.
